Bucharest, Microbiologia, Parazitologia, Epidemiologia, Vol 11, No 6, Nov-Dec 66, pp 569-572.

Abstract: The authors discuss a number of factors which may affect the antidiphtheria antibody titer obtained by the Boyden method. The discussion involves the preparation and quality of the tannic acid and the erythrocyte suspension, the antigen used, the determination of the endpoint of the reaction, and the influence of dilution and pipetting errors.

Includes 3 tables and 5 English-language references and one German reference. -- Manuscript submitted 20 April 1966.

"Titration of Antidiphtheria Antibodies by Passive Hemagglutination (Boyden Procedure). Note II. Comparison of the Titers Obtained by the Boyden and the Biological Methods."

Bucharest, Microbiologia, Parazitologia, Epidemiologia, Vol 11, No 6, Nov-Dec 66, pp 572-573.

Abstract: The authors carried out parallel determinations of the titer of antidiphtheria antibodies by the Boyden and the biological (Ehrlich-Ramon and Jensen) methods. The results show that the Boyden method of passive hemagglutination, under proper working conditions, is a sensitive and accurate method which, because of its simplicity, is recommended for use in Rumanian laboratories.

Includes one table and 4 references, of which one German and 3 English-language. -- Manuscript submitted 20 May 1966.

AUTHOR: Buzikov, Yu.M.

TITLE: Hydraulic Shock Absorber for Crank-Type Extrusion Presses

PERIODICAL: Kuznechno-shtampovochnoye proizvodstvo, 1960, ² N^o. 7 pp. 27 - 31

TEXT: The author has designed a hydraulic shock absorber based on a new principle, for which he has obtained an Author's Certificate (No. 15607). It reduces the slide block speed to near zero at the moment when the top die contacts the blank to be extruded to start the extrusion process under conditions near those under statical load and at the same time to prevent overloading. In a 250-ton extrusion slide block press with the hydraulic shock absorber the walls of the cylinder work portion are provided with slits which have a varying cross section area and the work fluid flows through the slits into an annular duct communicating with a container. The operation is fully described. It was stated in the tests on this 250-ton press that the shock absorber has worked well. The extrusion started smoothly without any perceptible impact; the protective phosphate coating on the blanks remained intact; the work surface quality improved; the life of extrusion dies increased. The oscillograms (Fig. 4) were prepared

A162/A029

Hydraulic Shock Absorber for Crank-Type Extrusion Presses

for comparison in operation of a usual extrusion crank press (a) and of one fitted with the shock absorber (b). It is concluded that the work speed and productivity of existing extrusion presses can be considerably increased when they are fitted with such a shock absorber and that it should be used in new presses under development. There are 4 figures.

Modernizatsiya kuznechno-shtampovochnogo oborudovaniya (Moderni-
zation of Die-Forging Equipment) Moscow, Mashgiz, 1961. 226 p.
Errata slip inserted. 10,000 copies printed.

Reviewer: V. Ye. Nedorezov, Candidate of Technical Sciences; Ed.
of Publishing House: T. L. Leykina; Tech. Ed.: A. A. Bardina;
Managing Ed. for Literature on Machine-Building Technology
(Leningrad Department, Mashgiz): Ye. P. Naumov, Engineer.

PURPOSE: This book is intended for foremen, machinists, designers,
and process engineers concerned with the modernization and de-
signing of die-forging equipment. It may also be used by students
at schools of higher education.

COVERAGE: The book contains material presented at the Conference
Card 1/8

Modernization of Die-Forging Equipment

SOV/5658

27
on Problems in the Modernization and Operation of Die-Forging Equipment, held in November 1958 in Leningrad. The Conference was called by Leningradskiy Sovet narodnogo khozyaystva, Sektsiya obrabotki metallov davleniem Leningradskogo oblastnogo pravleniya NTO Mashprom (Leningrad Council of the National Economy, Section of Metal Pressworking at the Leningrad Oblast Board of the Scientific and Technical Society of the Machine Industry) and Leningradskiy mekhanicheskiy institut (Leningrad Mechanical Engineering Institute). Actual problems in the modernization, operation, and repair of die-forging equipment are described. Analyses are provided for problems involved in the mechanization and automation of die-forging and stamping operations. Also included are practical data to be used in the modernization of equipment. No personalities are mentioned. There are 59 references:
56 Soviet, 2 German, and 1 English.

TITLE: A device for transverse ball rolling of thin-walled pipes. Class 7, No. 181595

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 10, 1966, 16

TOPIC TAGS: pipe, metal rolling, rolling mill

ABSTRACT: This Author's Certificate introduces a device for transverse ball rolling of thin-walled pipes. The unit contains a ball race with adjustment mechanism. Pipes with rigid tolerances in geometric dimensions are produced by using a ball race which has a floating suspension in the transverse direction to the axis of the pipe in ball guides. In addition, the unit has a mechanism for automatically opening the race at the end of the rolling process and setting it to the previous pipe size before rolling.

TITLE: An installation for making a bellows from tubular stock. Class 7, No. 188473

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 22, 1966, 31

TOPIC TAGS: material deformation, pipe, bellows, hydraulic equipment, machine tool

ABSTRACT: This Author's Certificate introduces: 1. An installation for making a bellows from tubular stock by successive hydraulic formation of each corrugation. The unit contains a mandrel for the tubular blank with channels for fluid supply, a movable corrugation tool, a mechanism for moving the tube through the required spacing for the corrugations with a hydraulic drive and sealing rings. The unit is designed for increased production accuracy and for making bellows with various pitches and outside diameters without changing the mandrel. The installation is equipped with a pipe gripping device and the hydraulic cylinder is located inside the mandrel. There is a nut on the piston rod for regulating rod travel in the preliminary operation of setting up the material for shaping the bellows. The mechanism for moving the tube through the required corrugation pitch is connected to this nut.

Card 1/3

ACC NR: AP7000314

2. A modification of this installation in which the tube clamping mechanism is made in the form of a stationary clamping disc connected to the hydraulic cylinder. This disc has grooves for sealing rings which clamp the tube section along the corrugations. The clamping device also includes a disc with a groove for a ring which compresses the uncorrugated section of the tube located on a sleeve moved by the piston in the hydraulic cylinder along its outer surface. 3. A modification of this installation in which the mechanism for moving the tube through the required pitch for the corrugations is made in the form of a fluted and threaded socket coupled with a fluted and threaded sleeve mounted on the piston rod to set its initial position when the tube is being moved. Two axially rotating cylinders are mounted on the cover of the hydraulic cylinder which moves the tube.

"The Action of Ultrasound on Koch bacillus."

Bucharest, Microbiologia, Parazitologia, Epidemiologia, Vol 11,
No 6, Nov-Dec 66, pp 549-557.

Abstract [Authors' English summary modified]: The authors studied the effects of sound fields with a total power of 150 to 250 watts at constant temperature on cultures of Koch bacilli dispersed in normal saline from a solid Loewenstein-Jensen medium. The dissemination of the bacilli in the dispersion media was also studied, as were their frequency, the proportion of live bacilli to the initial amount, cultivation characteristics in solid and liquid media, development of the germs under the activity of ultrasound waves and in the presence of antibiotics. Among the conclusions were that ultrasound brings about a numerical reduction of the bacilli but does not change their basic characteristics.

TITLE: Frequency division using tunnel diodes

PERIODICAL: Moscow. Universitet. Vestnik. Seriya III. Fizika, astronomiya, no. 1, 1963, 92 - 93

TEXT: Second kind resonance was achieved in an oscillatory circuit using a germanium tunnel diode whose end-point frequency had the order of magnitude 10 Mc/sec. In the decreasing section of the diode characteristic the operating point of the diode was close to the current minimum. The region wherein resonance is detuned and a stable frequency division was observed broadens with increasing amplitude, reaches a maximum and then decreases. The frequency division shows a coupling-hysteresis effect. There are 2 figures.

Orig Pub: Klinika i lechenie zabolevany zheludka. Ordzhonikidze, 1956, 119-126.

Abstract: Specimens from 14 patients were studied histologically. Pieces were taken from the region of the ulcer along the lesser and greater curvature of the stomach. For checking purposes, three stomachs of dogs and one stomach of a man, who died from insultus, were investigated. In all cases of ulcerous lesions, deep-seated changes of the intramural apparatus of the stomach were observed. In the

Abstract: composition of nerve fascicles there appears a great number of fibers (F) with degenerated changes: intensely colored swellings and thickenings in the shape of drumsticks. In very advanced cases, the basic mass of F disintegrates into short fragments, or the fascicles are transformed into formless and structureless formations. In vascular receptors of a special type (clusters, nodules), pathological changes also are clearly expressed. Changes in the nerve cells of the ganglia of the muscular and submucous layer often are observed. The cells are deformed, wrinkled and densely impregnated; the cytoplasm is vacuolized. The branches are thickened and have bulbous or spindle-shaped swellings. So-called cells of irritation often are encountered. -- T. N. Ulissova

of positive Gaussian curvature. Akad. Nauk Uzbek.
SSR. Trudy Inst. Mat. Meh. 9, 124-136 (1952). (Russian)

Starting from the stress equilibrium equations, in terms
of Gaussian coordinates, for a flexible inextensible material,
the author goes over to isotropic slightly extensible ma-
terial by a small variation in which the external forces are
kept unchanged. This with the aid of Hooke's law leads to a
system of equations for the stresses. The scope is that of
the linear theory. L. M. Milne-Thomson (Greenwich).

"A Class of Flexible Bisectional Surfaces of Revolution and the
Stresses in Them"

Izv. Ak. Uzb. SSR, No 6, 1953, pp 65-74

The author considers the problem of an axisymmetric momentless shell of revolution. The assumption is made that the shell is subjected to a surface load and to meridional forces on two regions along the parallel. The freedom of distortion of the shell is not restricted. The author's purpose is to find surfaces for which equivalence is possible under the given conditions. (Rzhmat, No 2, 1955)

ACCESSION NR: AP4038943

8/0241/64/000/005/0050/0058

AUTHOR: Kiselev, P. N.; Buzini, P. A.

TITLE: Remote immunologic sequelae of the effect of ionizing radiation

SOURCE: Meditsinskaya radiologiya, no. 5, 1964, 50-58

TOPIC TAGS: immunologic sequelae, ionizing radiation, immunogenesis, immunity retention, *Salmonella enteridis* Gartneri, *Salmonella breslau*, *Pseudomonas aeruginosa*, endotoxin sensitivity, bacteremia, phagocytosis, delayed postirradiation infection, mononuclear phagocyte, polynuclear phagocyte, infection resistance, antibody synthesis, vaccination

ABSTRACT: The duration of retention of natural immunity and immunogenesis acquired during acute radiation sickness was studied in guinea pigs and white mice which received 200 r ($LD_{30/30}$ days) and 465-500 r ($LD_{50/30}$) respectively. Resistance to infection was tested 3-28 months after irradiation, in either spontaneously infected animals or by infection with *Salmonella enteridis* Gartneri, *Salmonella breslau* or *Pseudomonas aeruginosa*. Endotoxin sensitivity was investigated by introducing

Card 1/4

ACCESSION NR: AP4038943

the endotoxin in a LD_{50/3} days dose and the bacteremia determined by microbial count in blood and organs. The number of leucocytes in peripheral blood, phagocytic activity in peritoneal exudate, etc. served as immunologic indicators. Spontaneous infection of the mice with *Salmonella enteridis Gartneri* after 5½ months led to the death of 58% irradiated against 18% of non-irradiated animals. Experimental infection with 100 million bodies of the same agent in 380 mice, half of which had been irradiated 6 months earlier, led to death of 72% of the irradiated, 38% of the control mice. *Salmonella breslau* infection under the same conditions yielded the corresponding figures of 97 against 65%. Spontaneous infection of guinea pigs with *Pseudomonas aeruginosa* 19 months after irradiation led to death of 32 against 14%. Experimental infection with the same agent in a group of mixed age was performed 3, 6, 9, 12, 19 and 28 months after irradiation. Increased sensitivity to infection (compared to controls) decreased only after the 19th month, to return to normal after 28 months. A study of the reasons for such increased sensitivity comprised testing the bactericidal property of the blood against *Salmonella typhi murium*, the complement titer, phagocytic activity of leucocytes, bacteremia in mice with acute and chronic radiation sickness, as well as in controls 6 months after irradiation. Microbe lysing activity was found decreased

Cord 2/4

ACCESSION NR: AP4038943

despite close to normal counts. Similar studies with *Pseudomonas aeruginosa* in guinea pigs 3-28 months after irradiation showed e.g. a decrease in mononuclear and increase in polynuclear phagocytes, their numbers returning to normal only after 28 months. Microbial count in guinea pig blood at various periods following irradiation confirmed the decreased phagocytic activity as late as 19 months after irradiation. Mouse sensitivity to *Salmonella typhi abdominalis* endotoxin was 2.6 times that of controls after $2\frac{1}{2}$ months, 1.6 times after $5\frac{1}{2}$ months. The development of antibodies to *Salmonella breslau* under these conditions was determined in guinea pigs vaccinated 3, 12 and 19 months after irradiation. No disturbance of immunogenesis was found; thus antibody synthesis is only disturbed during acute radiation sickness. Decreased anti-infective properties of the tissues however, although not irreversible, persist during half of the life span of guinea pigs and white mice. Orig. art. has: 5 tables and 6 figures.

M Mikrobiologiya 24, 639-44 (1955); cf. C.A. 49, 12004h.

Cell-free filtrates from *Nitrosomonas europaea* retain enough enzyme activity for copious oxidation of NH₃ to nitrite, reaching a peak reaction rate on the 1st or 2nd day and tapering off after the 5th day. Usually the peak nitrite content in the culture is reached in 19-27 days, followed by a decrease. Not all the evolved NH₃ appears as nitrite; the deficit is greater in acellular filtrates than in cell cultures. Total N content remains const. in both cases (no deficit at the end). Comparative tests with *Mycobacterium rubrum* showed copious NH₃ formation but only slight oxidation to nitrite. Julian F. Smith

439-441.

Abstract: The author discusses the difficulties faced by public health workers in dealing with the problem of malnutrition in view of the economic and social factors beyond the control of the health service. Direct action by the public health service can include study of the nature and magnitude of nutritional disturbances, provision for supplementary meals for mothers and children when possible, support for better nutrition within the framework of general health education, courses and seminars for active health workers, improvement in hospital dietetics, collaboration on school kitchens, etc. One Western reference.
